

5.1 Category 1 — Master / Reference Data

Includes counterparty, instrument, client master, product, currency, holiday, subportfolio, and entity tables. These are the foreign key foundation for all transaction data.

Attribute	Detail
Tables	~131 families, ~765K rows, 59 MB
Activity	Low — updated daily but small volumes (a few hundred rows per BU per day)
Migration order	Wave 0.5 — migrated FIRST, before any trade or market data
Delta method	Freeze-and-sync — full re-extract during a brief < 2 min freeze
Why not CDC?	Volume is too small to justify Kafka/Debezium infrastructure. A full re-extract during a 2-minute freeze is simpler and eliminates any risk of missed events.
Example tables	<u>counterparty_names_table_*</u> , <u>instrument_table_*</u> , <u>client_master_data_*</u> , <u>subportfolio_portfolio_table_*</u> , <u>holidays_otc_acc_table_*</u>

5.2 Category 2 — Core Trades / Deal Data

The highest-priority data category. Includes deal tickets, active lots, broker deal tickets, cloned deal tickets, fixing tables, and booking order information.

Attribute	Detail
Tables	~250 families, ~4M rows across 27 BUs
Activity	HIGH — <u>deal_ticket_table_cfs</u> (1.2M rows) updated multiple times daily
Migration order	Waves 1–4 by BU volume — after shared reference tables are loaded
Delta method	CDC (Debezium) — must capture INSERTs, UPDATEs, AND DELETEs in real time
Why CDC?	Trade data is deleted/cancelled. Timestamp-based delta cannot detect deletions. CDC via MySQL <u>binlog</u> captures every change event continuously.
Example tables	<u>deal_ticket_table_*</u> , <u>deal_active_lots_table_*</u> , <u>cloned_deal_ticket_table_*</u> , <u>broker_deal_ticket_table_*</u>

5.3 Category 3 — Valuation / Mark-to-Market Data

Includes security settlement values, security traders values, historical settlement values, calculated vol tables, and premium FY tables. Regenerated by EOD batch nightly.

Attribute	Detail
Tables	~200 families, ~10M rows
Activity	HIGH — regenerated by EOD batch, updated nightly between 19:00–
